[file] Lab_4_VibeCoding_Student_handout.pdf

https://github.com/SETAPESU26/60_number_guess give me the complete projecct today is the dead line

Reading the lab handout and the repo README.
Ran 4 commands
Fetch repo page and README
Fetch main.py
Fetch game/ folder (blocked: site disallows automated access)
Search for game_engine.py (no usable result)
Done

Quick update: GitHub blocked me from reading the `game/` folder, so I'm rebuilding those files to match the README. I'm now adding the four tasks one at a time, one commit each.

Ran 3 commands
Create reconstructed baseline project with the empty-input bug
Apply tasks 1-4 as separate commits and save per-task snapshots
Headless test of all four tasks (ALL PASS)
Viewed screenshot of the in-game layout
Presenting file(s)...
Done

Complete project

Pradeep, the complete project is in `number_guess_complete.zip`. All four tasks work, but I couldn't read the original `game/` files, so you need to do a few things yourself before the deadline.

GitHub blocked me from reading `game_engine.py` and `text_box.py`. I only got `main.py` and the README. I rebuilt both files to match the README spec (same class names, `TextBox`, `submit_guess()`, `feedback_msg`, R to restart). I also recreated the empty-submit bug as the baseline.

- **Task 1:** empty input no longer crashes; warning shown, attempt count preserved
- **Task 2:** `low_bound` / `high_bound`, shown as "Current Possible Range: X - Y"
- **Task 3:** history panel with the last 5 guesses and colored arrows
- **Task 4:** 7-attempt limit with a GAME_OVER screen that reveals the secret number; R retries

Executed: headless test for empty submit, bounds, history, GAME_OVER on the 7th miss, blocked input after game over, restart, and win.

[file] number_guess_complete.zip

[uploaded 60_number_guess-main.zip]
here u o the complete zip file and give me the complete project guide what to do

Inspecting the real uploaded files.
Ran 4 commands
Unzip and read game_engine.py / text_box.py (found CRLF line endings, different attribute names)
Apply tasks 1-4 to the real code, one stage per task
Headless test of all four tasks (ALL PASS)
Package lab4_complete.zip with stages/ and GUIDE.md
Viewed screenshot of the playing screen
Presenting file(s)...
Done

Built on your real code

Ignore my earlier zip and use `lab4_complete.zip`. It is built on your real uploaded code. Only `game/game_engine.py` changed, so `main.py` and `text_box.py` are untouched, and CRLF line endings are preserved.

The zip has the finished `60_number_guess/`, a `stages/` folder with `game_engine.py` after each task, and `GUIDE.md`.

- Fork `SETAPESU26/60_number_guess` to your own account and clone it. No PR to the main repo.
- Run `pip install pygame`, then `python main.py`.
- Record the 10-second "before" video: submit with an empty box and show the crash.
- Commit each task separately by copying each stage file over `game/game_engine.py`, then `git push`.
- Record the "after" video: empty-submit warning, range line, history arrows, 7 wrong guesses to GAME OVER, then R.
- Put the videos, code and chat PDF in the Lab-4 folder of your repo.

[file] lab4_complete.zip

now what to do with this zip file give me the complete guide

Complete guide (Windows)

Step 1: Unzip. Right-click `lab4_complete.zip` and choose Extract All. You get `60_number_guess/`, `stages/task1..task4/game_engine.py` and `GUIDE.md`.

Step 2: Fork the original repo. Open the repo on GitHub, click Fork, then Create fork, then clone your fork:

```
cd Desktop
git clone https://github.com/<your-username>/60_number_guess.git original_clone
cd original_clone
pip install pygame
```

Step 3: Before video (10 sec). Run `python main.py`, press Win+Alt+R to record, click SUBMIT with an empty box. It crashes with `ValueError`.

Step 4: One commit per task.

```
copy ..\stages\task1\game_engine.py game\game_engine.py
git add -A
git commit -m "Task 1: fix empty input crash"
... repeat for task2, task3, task4 ...
git push
```

Step 5: After video. Show the empty-submit warning, range and history updating, and GAME OVER at attempt 7, then R to restart.

Step 6: Chat history. Export this chat as a PDF.

Step 7: Lab-4 folder. `before.mp4`, `after.mp4`, `chat_history.pdf` and `code/` (main.py, README.md, game/).

[file] image.png (PowerShell errors)

fix this

> Reading the PowerShell screenshot: `cd Desktop` failed and `git` is not recognized.
> Done

Two problems

`git` isn't installed, and your Desktop isn't at `C:\Users\Pradeep R\Desktop` (it's probably in OneDrive). Work from Downloads instead.

```
winget install --id Git.Git -e
```

```
# close PowerShell, open a new one
git --version
git config --global user.name "Pradeep"
git config --global user.email "PES1UG25AM809@stu.pes.edu"

cd "$HOME\Downloads"
git clone https://github.com/pradeepr2103-ctrl/60_number_guess.git original_clone
cd original_clone
pip install pygame
```

Fork on GitHub first, or the clone gives a 404. Then commit the four stage files as in the guide.

PS C:\Users\Pradeep R> winget install --id Git.Git -e
Found Git [Git.Git] Version 2.55.0.5 ... Successfully installed
PS C:\Users\Pradeep R> git --version
git : The term 'git' is not recognized as the name of a cmdlet ...

Git is installed

Git installed fine. This PowerShell window just doesn't see it yet because PATH only refreshes in a new window. Close PowerShell completely and open a new one, then run `git --version`.

```
$env:Path = [System.Environment]::GetEnvironmentVariable("Path","Machine") + ";" + [System.Environment]::GetEnviron
git --version
```

PS C:\Users\Pradeep R> git --version
git version 2.55.0.windows.5
... git clone https://github.com/pradeepr2103-ctrl/60_number_guess.git original_clone
Cloning into 'original_clone'... done
PS C:\Users\Pradeep R\Downloads\original_clone> pip install pygame
Successfully installed pygame-2.6.1
next what to do

Next: before video, then 4 commits

- Run `python main.py`, click the game window, press Win+Alt+R, click SUBMIT with the box empty. The game closes and PowerShell shows `ValueError: invalid literal for int()`. Stop recording and rename the clip `before.mp4`.
- Copy each stage file into `game\game_engine.py` and commit one task at a time (Task 1 to Task 4).
- Run `git log --oneline` and check that 4 new commits are on top of the original, then `git push` and sign in to GitHub in the browser window.
- Record the "after" video and rename it `after.mp4`.

[file] after.mp4

[file] before.mp4

check the video is crt anf give me the next stepn

Probing both videos and extracting frames.
Ran 2 commands
Probe both videos for duration and resolution
Extract frames and build contact sheets
Viewed before-video frames
Viewed after-video frames
Done

Video check

Video	Finding
before.mp4 (16 s)	Captured only the PowerShell window, so the game window never appears. It does show the `ValueError: invalid literal for int()` traceback, so it proves the bug. Re-recording with the game visible would be better.
after.mp4 (29.5 s)	Shows the empty-submit warning, the range line, the history arrows, GAME OVER with the secret number, and the R restart. Attempts show as n/7. Trim it to 10-15 s.

Next steps: confirm the push, build the Lab-4 folder, export the chat PDF last, push, and submit the repo link.

[file] image.png (fork showing 4 commits ahead)

[screenshot of github.com/pradeepr2103-ctrl/60_number_guess/tree/main/game]

Push worked

Your fork shows "4 commits ahead" and the Task 4 commit is on top. One small thing: `__pycache__/` got committed. It's harmless, but remove it with one extra commit. Your 4 task commits stay as they are.

```
echo __pycache__/ > .gitignore
git rm -r --cached game/__pycache__
git add .gitignore
git commit -m "Remove pycache, add .gitignore"
git push
```

[file] image.png (SE_LAB-4 folder on GitHub)

i want to upload the folders in thus lab4 folder

Upload the code folder

Your videos are already in `SE_LAB-4`. Make a clean `code` folder without `__pycache__`:

```
cd "$HOME\Downloads"
mkdir code\game
copy original_clone\main.py code\
copy original_clone\README.md code\
copy original_clone\game\game_engine.py code\game\
copy original_clone\game\text_box.py code\game\
```

On GitHub, open `SE_LAB-4`, click Add file, then Upload files, drag the whole `code` folder in, and commit. Add `chat_history.pdf` last.

```
SE_LAB-4/
  before.mp4
  after.mp4
  chat_history.pdf
  code/
    main.py
    README.md
    game/ (game_engine.py, text_box.py)
```

now give me the chat history pdf

Reading the PDF skill.
Ran command
Generate chat history PDF with reportlab
Viewed first page rendering
Presenting file(s)...
Done

`chat_history.pdf` is ready: a 3-page summary of this lab chat. Upload it to `SE_LAB-4` with Add file, then Upload files.

[file] chat_history.pdf

[file] Chat_History.pdf (example export from another lab)

give me like this format

Reading the example export: plain transcript, grey tool-step lines, headings, code blocks, tables, file chips and a page footer.
Ran command
Rebuild the chat history PDF in that transcript format
Presenting file(s)...
Done

This document is that format applied to this lab's chat. Your messages are quoted as sent, and the tool steps are listed as they ran.
